

SignaSoft starts a new software approach for dedicated applications in the world of electronic measuring of material properties, such as strain, stress, load, force, displacement, etc. It is loaded with features, typically needed in this special field of applications. Whereas, up to now, similar software was built as dedicated programs, SignaSoft now is highly modular and offers a wide range of interactive possibilities with a host of other, universal technical experimental software packages.

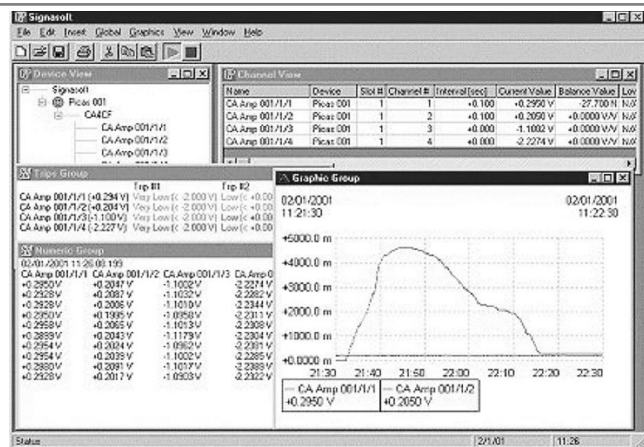

The structured use of ActiveX controls facilitates a high level of connectivity with today's IT concepts.

SignaSoft offers full control of automatically logging your measured data. You can view data in a graphical or numerical form.

During certain measuring sessions, you may wish to be alerted or you may want to control the measuring process. For that purpose, you can adjust up to 4 trip-levels for each channel.

SignaSoft's ActiveX controls are also available for use with other, third party, software packages.

- Data acquisition, incl. trigger functionality
- Online graphic/numeric
- Thresholds
- Server functionality

### Ordering Information

Product	Part No.
SignaSoft	240776

### Main Features

- Easy operation
- Supports modules of the series
  - ISM 100
  - e.bloxx
- Measurement data acquisition with online-graphic and numeric
- Binary data storage with export functionality into ASCII- or Diadem® format
- Alarm functionality
- Server functionality

Valid from February 9<sup>th</sup> 2004. Specification subject to change without notice.
